

PURPOSE

All transformer manufacturers installing IFD Sensors must obtain and maintain IFD Certification. This process was designed to benefit both transformer manufacturer and end-user utilities as it ensures high quality IFD Sensor installations.

CERTIFICATION FEE

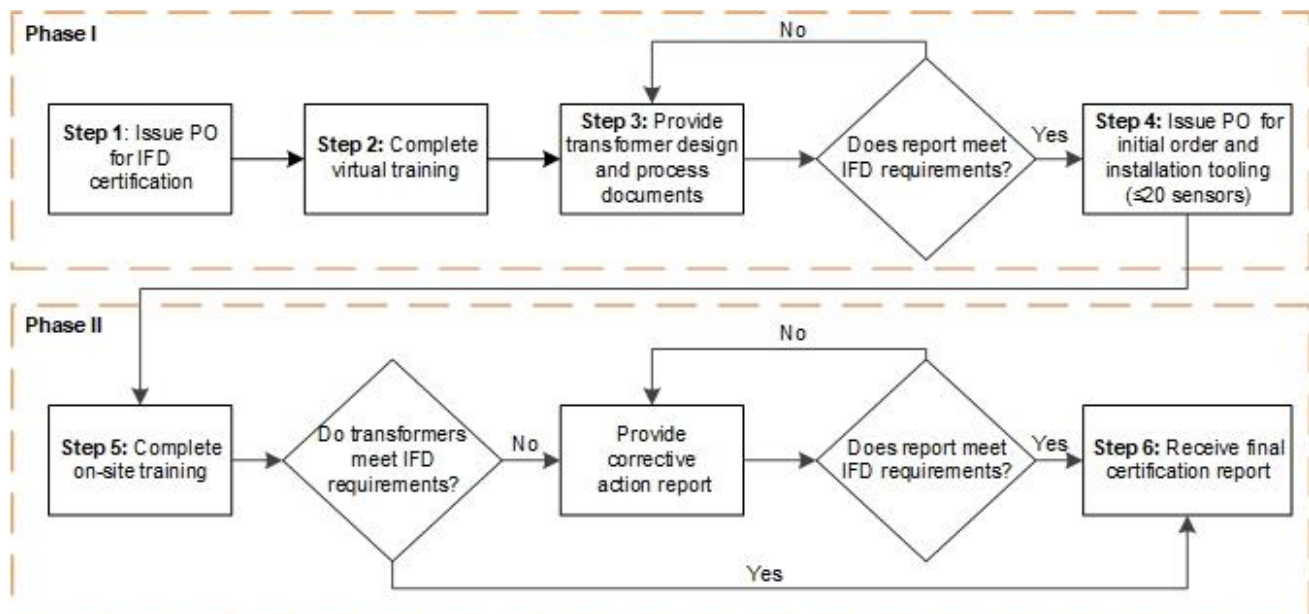

As part of the certification process, transformer manufacturers are required to pay a **\$10,000 USD** certification fee. This fee includes:

- Training with the IFD Engineering team for your transformer designers, process engineers as well as installers and QC operators
- OEM Training Kit which includes demo sensors and tooling samples
- Access to training material including visual work instructions, training videos and more

This certification fee can be split into two payments. Transformer manufactures may choose to pay an initial deposit of \$2,500 USD which will allow them to complete Phase I of the training. Transformer manufactures then must pay the remaining \$7,500 USD to complete the certification process.

CERTIFICATION PROCESS

The key steps of the IFD Certification Process are outlined below. Typically, this process ranges from 1 - 2 months. **This process must be completed before you can place production orders.**

Note: Phase II training must be completed within 3 years after completing Phase I training.

OBTAINING AND MAINTAINING CERTIFICATION

Once you successfully complete the process you will receive a final certification report indicating you have been certified by IFD Technologies to install IFD Sensors. **This certification status will last for 1 year and will automatically be extended provided you meet the following requirements:**

1. Ship a minimum of 60 IFD-equipped transformers to end-user utilities every year.
2. Provide a quarterly report to IFD Technologies listing shipped-to utilities and quantities. This enables us to provide training to all utilities using IFD Sensors and appropriately compensate our sales representatives. This information will be treated by us as strictly confidential.
3. Participate with IFD Technologies to investigate quality events that occur at end-user utilities. This involves returning IFD Sensors to us for analysis and inviting us on-site to help identify possible root causes at your facilities where appropriate.

Failure to meet these requirements may result in a need to repeat some or all of the certification process. This will be evaluated by IFD Technologies on a case-by-case basis.

QUESTIONS?

For further information or to get started with the IFD Certification Process, contact IFD Operations at accountsifd@ifdtech.com or 1-604-734-0105.
